

AI Imposter – Hackathon

Members:

Tuval Zitelbach

Daniel Chernov

Description

AI Imposter is a real-time multiplayer party game where players answer funny questions and try to identify which answer was written by AI.

Each round starts with a funny question. Every human player submits an answer, and the system also generates one AI answer using AI API. After all answers are collected, the answers are displayed anonymously. The players then vote for the answer they believe was written by AI.

Target Users

Guest / Player

In the MVP, all users are guests.

There are no registered users, no admin users, and no host role.

A guest becomes an active player after entering a valid nickname and joining the shared lobby.

Admin

Admin is not part of the MVP.

In a future version, an admin will be able to manage the question database, add new questions, edit existing questions, and organize questions by categories or age groups.

Host

Host is not part of the MVP.

In a future version, when multiple rooms are supported, the player who creates a room may become the host and control when the game starts.

Use Cases

Guest / Player

The guest/player can:

- Enter a nickname.
- Join the shared lobby.
- See other players in the lobby.
- Mark themselves as ready.
- Wait for the game to start automatically.
- View the countdown before the game starts.
- View the current question.
- Submit an answer during the answering phase.
- View all submitted answers anonymously.
- Vote for the answer they think was written by AI.
- See the reveal screen after each round.
- See who guessed correctly and incorrectly.
- See the updated leaderboard.
- Continue through 5 rounds.
- View the final podium.

- Click Play Again.
- Return to the lobby after Play Again.
- Mark themselves as ready again for a new game.
- Quit the game.

Admin — Future Scope

The admin will be able to:

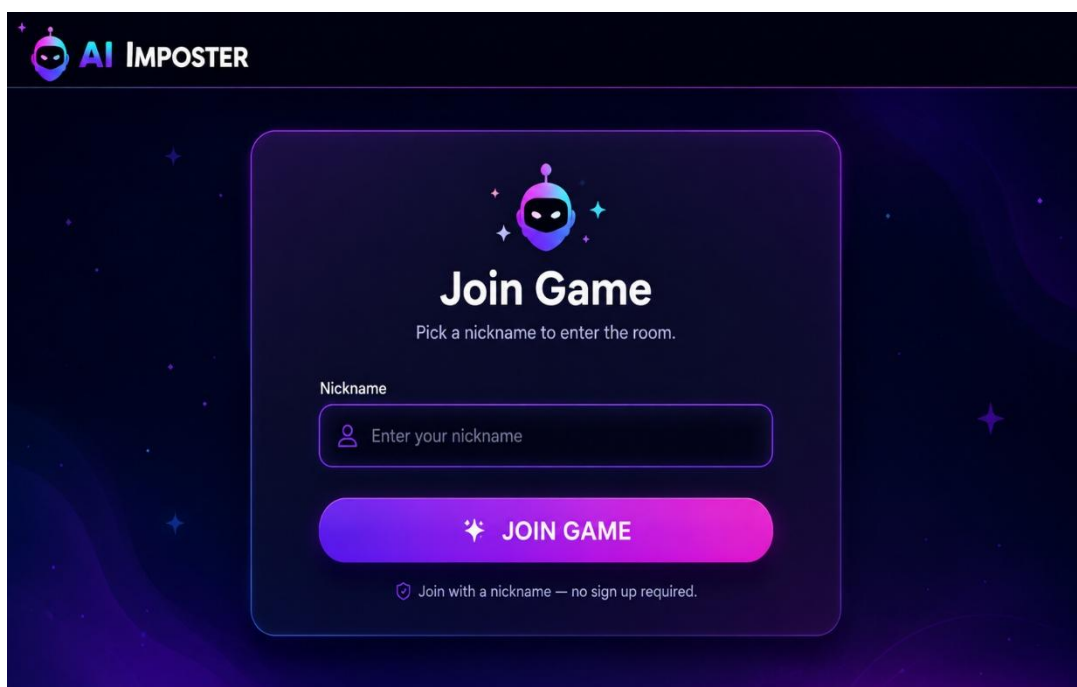

- Add new questions.
- Edit existing questions.
- Delete questions.
- Add fallback AI-style answers.
- Manage question categories.
- Create age-based question sets.
- Control which questions are available in the game.

Host — Future Scope

The host will be able to:

- Create a new room.
- Share a room code with other players.
- See who joined the room.
- Start the game when all players are ready.
- Control the room flow before the game starts.

VOTING ENDS IN

What is the worst excuse for being late to work?

Pick the answer you think was written by AI

My GPS took me on a scenic route.

I was stuck in a Netflix episode.

A flock of pigeons held a union meeting on my windshield.

Time zones got confused again.

No valid answer submitted

I had to teach my dog how to dog.

SUBMIT VOTE

Your vote is final and cannot be changed.

🔗 QUIT GAME

Game Flow

The game flow starts when a player enters a nickname and joins the shared lobby.

After all required players press Ready, a short countdown begins and the game starts automatically.

Each round includes an answering phase, a voting phase, and a round results phase where the AI answer, votes, and points are revealed.

This flow repeats for 5 rounds, and then the results screen shows the podium, with options to Play Again or Quit.

APIs

Supabase Database API

Supabase is used as the main database of the application.

It stores:

- Game session state
- Players
- Questions
- Rounds
- Answers
- Votes
- Scores

Supabase Realtime API

Supabase Realtime is used to synchronize the game state between all players.

Realtime updates are needed for:

- Players joining the lobby
- Players becoming ready
- Countdown start
- Phase changes
- Answers being submitted
- Votes being submitted
- Reveal results
- Leaderboard updates
- Final results

Supabase Anonymous Auth

Supabase Anonymous Auth is used behind the scenes.

Players still enter only a nickname, but the system can use an anonymous authenticated user ID to connect each browser session to a player row in the database.

Google AI API

Google AI API is used to generate the AI answer for each round.

The exact Google AI model or API may change during development.

If the AI API fails, takes too long, or returns an invalid response, the system will use the fallback AI-style answer stored in the questions table.

Extensions:

- Multiple rooms
- Room codes
- Host-controlled game start
- Admin panel for question management
- Question categories
- Age-based question sets
- Custom number of players
- Custom number of rounds
